Compact Powder Eye Shadow Series

ABS (Acrylonitrile Butadiene Styrene) material can be used in cosmetic packaging because it has several advantages that make it suitable for the application. ABS is a strong, impact-resistant, and easy-to-process thermoplastic plastic making it ideal for making containers, lids, and other components for cosmetics.

CM-201-01 PRESSED POWDER

12 gr
content

Dim : (L)72 x (W)65 x (H)15.5 mm
Pan Area : (L)55.8 x (W)47.6 x (H)4.7 mm

UV Metallized

UV Metallized Cosmetic is a cosmetic packaging coated with a metallic layer using UV curing technology. This coating provides a luxurious and premium appearance, as well as being durable and more environmentally friendly than traditional metallization methods.

UV Clear Coat

UV Clear Coat cosmetic is a clear layer applied to cosmetic products to provide protection and a shiny effect. This layer uses varnish material that is dried with ultraviolet (UV) light. In addition to providing a more attractive final appearance, UV clear coat also functions to protect the product from damage due to UV rays, scratches, and other environmental factors, as well as increasing the durability of the product.

Spray Matte

The method of making cosmetic packaging with a **Matte finish** involves the use of various techniques to create a surface that doesn't reflect light and gives a soft and elegant impression. Some of the commonly used methods are matte lamination, matte UV coating, and the use of special materials such as oxidized PE wax.

Spray Color

The method of making **Spray Color** on cosmetic packaging involves several stages, including product preparation, coloring, and application. Coloring can be done through various techniques such as spraying, electrostatic coating, or screen printing. The technique chosen depends on the type of packaging material, the desired effect, and the scale of production.

Screen Printing

Screen Printing in cosmetic packaging is a technique of printing designs, logos, or product information directly onto cosmetic packaging using stencils and ink. This technique allows for bright colors and detailed designs, and is suitable for a variety of cosmetic packaging materials such as plastic and glass.

Hot Stamping

Hot Stamping in cosmetic packaging is a decoration technique that uses heat and pressure to transfer a foil (usually metallic or holographic) onto the surface of the packaging, creating a shiny and luxurious effect. This technique is commonly used to add logos, text, or designs to cosmetic packaging, enhancing the visual appeal and premium feel of the product.

Heat Transfer Film

Heat Transfer Film in cosmetic packaging is a special type of film used to transfer a design or image onto the surface of cosmetic packaging using heat. This process allows for long-lasting, intricate detail printing on a variety of packaging shapes and sizes, giving it an attractive and professional look.

Heat Transfer Process:

In this process, the design or image is first printed onto a film which is then applied to the packaging. Heat is applied to transfer the ink from the film to the surface of the packaging, creating a permanent look.

Pad Printing

Pad printing on cosmetic packaging is an indirect printing technique that uses a silicone pad to transfer the image from the printing plate to the uneven or uniquely shaped surface of the packaging. This method allows for precise detailed printing on various shapes and textures of cosmetic packaging, such as bottles, tubes, and other containers.
